GATES SPACER TOOL

Gates have identified a common cause of premature timing system failures in popular vehicle applications and have consequently developed a tool to prevent these failures.

A large number of Subaru applications (manual transmissions) are fitted with a timing belt guide plate which is located directly above the crank shaft pulley. The guide plate's purpose is to prevent tooth jump and as such is required to be positioned very close to the timing belt.

If the guide plate is installed too close to the belt or if the bolts on the guide plate aren't tightened correctly the plate can make contact with the timing belt cover. Any contact between the plate and belt will cause friction and generate excessive heat.

Usually the first component to fail is the timing belt tensioner unit, as the tensioner is positioned very close to the guide plate. The extreme heat that is generated will compromise the bearings lubricant leading to bearing seizure/failure.

When installing the guide plate the natural rotation of the bolts that secure the guide plate will force the plate down towards the belt and if it goes unnoticed premature failure will be imminent.

Gates have seen cases where the heat generated by the friction of the plate rubbing on the belt has been so severe that bearings have disintegrated with less than 50 kilometres travelled.
